

You don't need surgery to get rid of varicose veins.

If you're one of the 25 million Americans living with the discomfort of varicose veins, ask

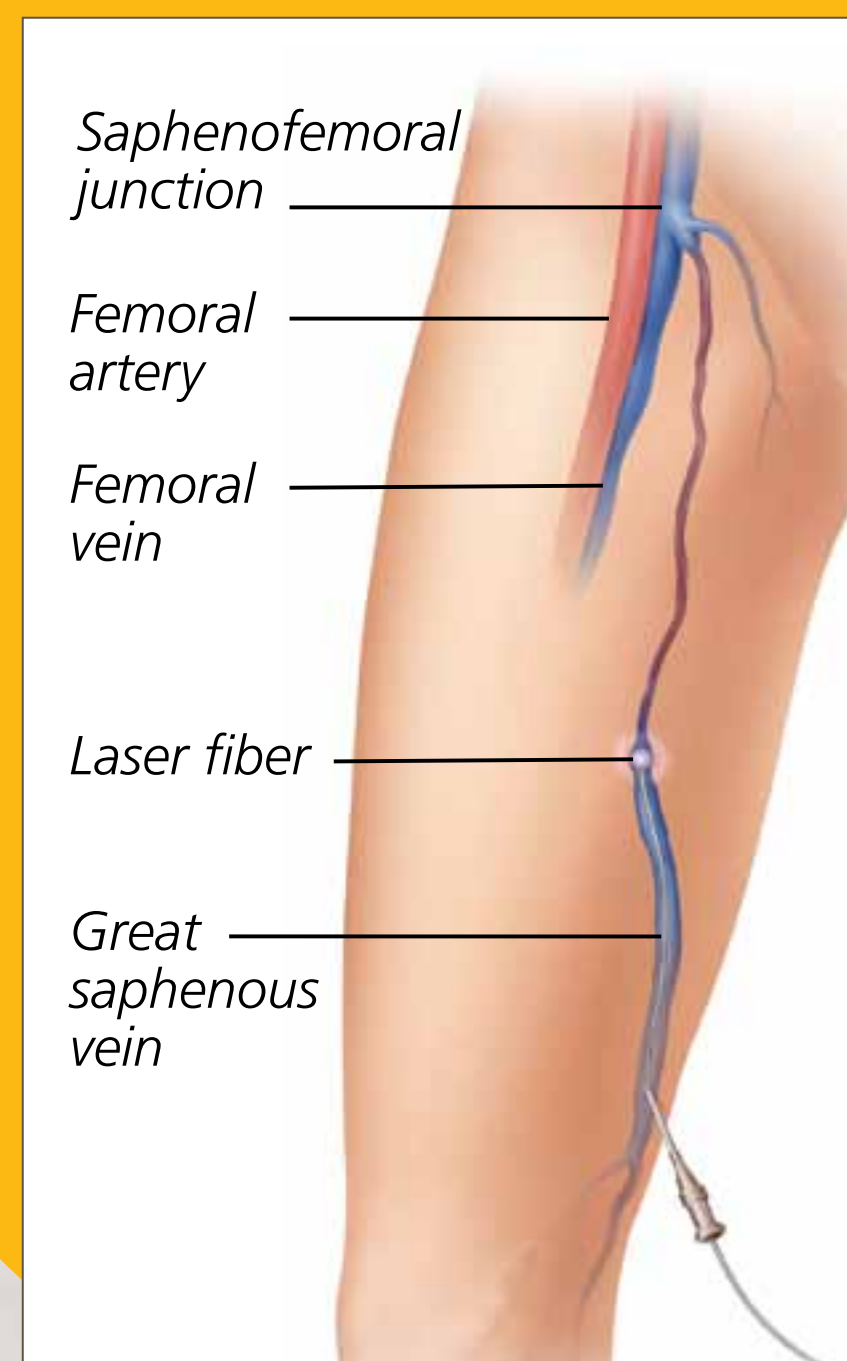

your doctor about the VenaCure EVLT™ laser treatment procedure. VenaCure EVLT is quick, safe, comfortable, and most important, effective.

In about one hour, you can be varicose vein-free – and enjoying life to its fullest.

VenaCure EVLT:

- Is a non-surgical, outpatient procedure
- Is minimally invasive, requiring no more than a needle-sized entry point
- Has little-to-no side effects
- Allows you to resume normal activity almost immediately
- Has been shown to be more than 95% effective in clinical trials

What causes varicose veins?

Varicose veins develop when normally toned, elastic vein walls become weak, allowing the re-circulating blood that should be moving toward your heart to flow backward. This blood then builds up against the vein wall, which leads to further damage and results in their twisted and bulging appearance.

How does VenaCure EVLT laser vein treatment work?

Utilizing the power of light energy, VenaCure EVLT seals the incompetent veins. The blood is then re-routed to healthy veins.

Speak with your doctor today, or visit www.VenaCure-EVLT.com — and see why more than half a million people have already chosen to eliminate their varicose veins the non-surgical way.
