*For varicose veins that require >1% Sotradecol, use 3% Sotradecol solution (see 3% Sotradecol chart).

Dilutions are based on the equation: 

$$ C_1 V_1 = C_2 V_2 $$

Where:

- $C_1$ = original concentration
- $V_1$ = original volume
- $C_2$ = desired concentration
- $V_2$ = final volume

---

"Dilution and Dosing" table above is intended as a general guideline for treatment with Sotradecol and is based on an investigator study.

**Important Safety Information continued on reverse**
Sotradecol® (Sodium Tetradecyl Sulfate Injection)

FOR INTRAVENOUS USE ONLY
Rx Only

DESCRIPTION
Sodium tetradecyl sulfate is an anionic surfactant which occurs as a white, waxy solid. The structural formula is as follows: C_{14}H_{29}O_{4}S Na. Sotradecol® (sodium tetradecyl sulfate injection) is a sterile nonpungent solution for intravenous use as a sclerosing agent.

1% (10 mg/mL): Each mL contains sodium tetradecyl sulfate 10 mg, benzyl alcohol 0.02 mL, and dibasic sodium phosphate, anhydrous 4.0 mg in Water for Injection. pH 7.9. monobasic sodium phosphate and/or sodium hydroxide added, if needed, for pH adjustment.

3% (30 mg/mL): Each mL contains sodium tetradecyl sulfate 30 mg, benzyl alcohol 0.02 mL and dibasic sodium phosphate, anhydrous 9.0 mg in Water for Injection. pH 7.9. monobasic sodium phosphate and/or sodium hydroxide added, if needed, for pH adjustment.

CLINICAL PHARMACOLOGY
Sotradecol (sodium tetradecyl sulfate injection) is a sclerosing agent. Intravenous injection causes intimal inflammation and thrombosis formation. This usually occludes the injected vein. Subsequent formation of fibrous tissue results in partial or complete vein obliteration that may or may not be permanent.

INDICATIONS AND USAGE
Sotradecol (sodium tetradecyl sulfate injection) is indicated in the treatment of small uncomplicated varicose veins of the lower extremities that show simple dilation with competent valves. The benefit-to-risk ratio should be considered in selected patients who are great surgical risks.

CONTRAINDICATIONS
Sotradecol (sodium tetradecyl sulfate injection) is contraindicated in previous hypersensitivity reactions to the drug, in acute superficial thrombophlebitis; valvular or deep vein incompetence; huge superficial veins with wide open communications to deeper veins; phlebitis migrans, acute cellulitis, arteritis, aneurysm, acute infections; varicose veins caused by abdominal and pelvic tumors unless the tumor has been removed; bedridden patients; such uncontrollable systemic diseases as diabetes, toxic hyperthyroidism, tuberculosis, asthma, neoplasm, sepsis, blood dyscrasias and acute respiratory or skin diseases.

WARNINGS
Sotradecol (sodium tetradecyl sulfate injection) should only be administered by a healthcare professional experienced in venous anatomy and the diagnosis and treatment of conditions affecting the venous system and familiar with proper injection technique. Severe adverse local effects, including tissue necrosis, may occur following extravasation; therefore, extreme care in intravenous needle placement and using the minimal effective volume at each injection site are important.

Emergency resuscitation equipment should be immediately available. Allergic reactions, including fatal anaphylaxis, have been reported. As a precaution against anaphylactic shock, it is recommended that 0.5 mL of Sotradecol be injected into a varicosity, followed by observation of the patient for several hours before administration of a second or larger dose. The possibility of an anaphylactic reaction should be kept in mind, and the physician should be prepared to treat it appropriately.

Because of the danger of thrombosis extension into the deep venous system, thorough preinjection evaluation for valvular competency should be carried out and slow injections with a small amount (not over 2 mL) of the preparation should be injected into the varicosity. Deep venous patency must be determined by noninvasive testing such as duplex ultrasound. Venous stenosis should not be used in patients with atherosclerosis. Venous sclerosis treatment should not be undertaken if tests such as Trendelenburg and Perthes, and angiography show significant valvular or deep venous incompetence.

The development of deep vein thrombosis and pulmonary embolism have been reported following sclerotherapy treatment of superficial varicosities. Patients should be observed post-treatment follow-up of sufficient duration to assess for the development of deep vein thrombosis. Embolism may occur as long as four weeks after injection of sodium tetradecyl sulfate. Adequate post-treatment compression may decrease the incidence of deep vein thrombosis.

PRECAUTIONS GENERAL
Extreme caution must be exercised in the presence of underlying arterial disease such as marked peripheral arteriosclerosis or thoracoabdominal obliterans (Buerger’s Disease). This usually occludes the injected vein. Subsequent formation of fibrous tissue results in partial or complete vein obliteration that may or may not be permanent.

DRUG INTERACTIONS
No well-controlled studies have been performed on patients taking anticoagulants. The physician must use judgment and evaluate any patient taking anticoagulants prior to initiating treatment with Sotradecol. (See ADVERSE REACTIONS section).

Pregnancy
Heparin should not be included in the same syringe as Sotradecol, since the two are incompatible.

Carcinogenesis, Mutagenesis, Impairment of Fertility
When tested in the L5178Y TK- magnified mouse lymphoma assay, sodium tetradecyl sulfate did not induce a dose-related increase in the frequency of thymidine kinase-deficient mutants and, therefore, was judged to be nonmutagenic in this system. However, no long-term animal carcinogenicity studies with sodium tetradecyl sulfate have been performed.

Pregnancy
Teratogenic Effects – Pregnancy Category C. Animal reproduction studies have not been conducted with Sotradecol. It is also not known whether Sotradecol can cause fetal harm when administered to a pregnant woman or can affect reproduction capacity. Sotradecol should be given to a pregnant woman only if clearly needed and the benefits outweigh the risks.

Nursing Mothers
It is not known whether this drug is excreted in human milk. Because many drugs are excreted in human milk, caution should be exercised when Sotradecol is administered to a nursing woman.

Pediatric Use
Safety and effectiveness in pediatric patients have not been established.

ADVERSE REACTIONS
Local reactions consisting of pain, urticaria, or ulceration may occur at the site of injection. A permanent discoloration may remain along the path of the sclerosed vein segment. Necrosis and tissue loss occurring following extravasation of the drug. (See WARNINGS section).

Allergic reactions such as hives, asthma, hay fever and anaphylactic shock have been reported. Mild systemic reactions that have been reported include headache, nausea and vomiting. (See WARNINGS section). At least six deaths have been reported with the use of Sotradecol. Four cases of anaphylactic shock leading to death have been reported in patients who received Sotradecol. One of these four patients reported a history of asthma, a contraindication to the administration of Sotradecol. (See WARNINGS section).

One death has been reported in a patient who received Sotradecol and who had been receiving an anticoagulant agent. Another death (fatal pulmonary embolism) has been reported in a 36-year-old female treated with sodium tetradecyl acetate and who was not taking oral contraceptives.

Dosage and Administration
Parenteral drug products should be inspected visually for particulate matter and discoloration prior to administration. Do not use if precipitated or discolored.

Sotradecol (sodium tetradecyl sulfate injection) is for intravenous use only. The strength of solution required depends on the size and degree of varicosity. In general, the 1% solution will be found most useful with the 3% solution preferred for larger varicosities.

The dosage should be kept small, using 0.5 to 2 mL (preferably 1 mL maximum) for each injection, and the maximum single treatment should not exceed 10 mL.

HOW SUPPLIED
Sotradecol (sodium tetradecyl sulfate injection) 1% (10 mg/mL) – 2 mL vials; in packages of 5, NDC 65974-162-03 3% (30 mg/mL) – 2 mL vials; in packages of 5, NDC 65974-163-02

STORAGE
Store at 20°C to 25°C (68°F to 77°F) (See USP Controlled Room Temperature).

Animal Toxicology
The intravenous LD₅₀ of sodium tetradecyl sulfate in mice was reported to be 90 ± 5 mg/kg.

In the rat, the acute intravenous LD₅₀ of sodium tetradecyl sulfate was estimated to be between 72 mg/kg and 138 mg/kg.

Purified sodium tetradecyl sulfate was found to have an LD₅₀ of 2 g/kg when administered orally by stomach tube as a 25% aqueous solution to rats in rats given 0.15 g/kg in drinking water for 30 days, no appreciable toxicity was seen, although some growth inhibition was discernible.
